## **SUMMARY OF LEAD SCORING CASE STUDY**

X Education company gets a lot of leads, lead conversion rate is around 30%. The company requires us to build a model wherein we need to assign a lead score to each of the leads such that the customers with a higher lead score have higher conversion chance. Target for lead conversion rate is around 80%.

- Data Cleaning and EDA
- 2. Data Preparation
- 3. Model Building and Evaluation

### **Data Cleaning and EDA:**

- Handle the select level. Dropping the columns with high percentage of missing values. Value
  counts within categorical columns were checked to decide appropriate action: if imputation
  causes skew, then column was dropped, created new category (others), impute high
  frequency value, drop columns that don't add any value.
- Numerical categorical data were imputed with mode and columns with only one unique response from customer were dropped.
- EDA: Data imbalance checked. Performed univariate and bivariate analysis for categorical and numerical variables. 'Lead Origin', 'Current occupation', 'Lead Source', etc. provide valuable insight on effect on target variable. Time spend on website shows positive impact on lead conversion.

#### **Data Preparation:**

- Created dummy features for categorical variables
- Splitting Train & Test Sets: 70:30 ratio
- Feature Scaling using Standardization

### **Model Building and Evaluation:**

- Used RFE to perform variable selection.
- Built a Logistic Regression Model.
- Manual Feature Reduction process was used to build models by dropping variables with p value > 0.05.
- Final Model 4 was stable with (p-values < 0.05). No sign of multicollinearity with VIF < 5. logm4
  was selected as final model with 13 variables and used it for making prediction on train and
  test set.</li>
- Confusion matrix was made and cut off point of 0.34 was selected based on accuracy, sensitivity and specificity plot. This cut off gave accuracy, specificity and precision all around 80%. Whereas precision recall view gave less performance metrics around 75%. Lead score was assigned to train data using 0.34 as cut off.

#### Top 3 features are:

- 1. Lead Source Welingak Website
- **2.** Lead Source\_Reference
- 3. Current\_occupation\_Working Professional

# **Observations/Recommendations:**

- Strategies to be developed to attract high-quality leads from top-performing lead sources.
- Optimize communication channels based on lead engagement impact.
- More budget can be spent on Welingak Website in terms of advertising, etc.
- Incentives/discounts for providing references that convert to leads.
- Working professionals to be targeted as they have high leadconversion rate.
